## Solid-state Timer

Miniature Timer Compatible with the MY
Relay
■ Large transparent time-setting knob facilitates time setting. Flat-blade and Phillips screwdrivers can also be used for time setting.

- Approved by UL and CSA.

■ Pin configuration compatible with MY Power Relay.
■ LED indication for power and output statuses.

- Conforms to EMC standards.

■ High repeat accuracy.

## Ordering Information

Reference: A maximum current of 0.6 A can be switched at $125 \mathrm{VDC}(\cos \phi=$ 1). Maximum current of 0.2 A can be switched if $L / R$ is 7 ms . In both cases, a life of 100,000 operations can be expected.
The minimum applicable load is 1 mA at 5 VDC ( P reference value).

## Precautions

When selecting a control output, use the H3Y-2 for switching ON and OFF the power and the H3Y-4 for switching ON and OFF the minute load.
The operating voltage will increase when using the H3Y in any place where the ambient temperature is more than $50^{\circ} \mathrm{C}$. Supply $90 \%$ to $110 \%$ of the rated voltages (at 12 VDC: $95 \%$ to $110 \%$ ) when operating at $50^{\circ} \mathrm{C}$ or higher.
Do not leave the H3Y in time-up condition for a long period of time (for example, more than one month in any place where the ambient temperature is high), otherwise the internal parts (aluminum electrolytic capacitor) may become damaged. Therefore, the use of the H 3 Y with a relay as shown in the following circuit diagram is recommended to extend the service life of the H3Y.

Do not connect the H3Y as shown in the following circuit diagram on the right hand side, otherwise the H3Y's internal contacts different from each other in polarity may become short-circuited.

Use the following safety circuit when building a self-holding or selfresetting circuit with the H3Y and an auxiliary relay, such as an MY Relay, in combination.

Do not use the H3Y in places where there is excessive dust, corrosive gas, or direct sunlight.
Do not mount more than one H3Y closely together, otherwise the internal parts may become damaged. Make sure that there is a space of 5 mm or more between any H3Y Models next to each other to allow heat radiation.
The internal parts may become damaged if a supply voltage other than the rated ones is imposed on the H3Y. When more than 100 V is applied to 12 or 24 VDC, the internal element (varistor) may break.
