■ TIMING CHARTS

Open Collector Output E6B2-CWZ6C

Direction of rotation: CW
Clockwise as viewed from the shaft → CW direction

Note:
Phase A is $1/4T \pm 1/8T$ faster than phase B. The ONs in the above timing chart mean that the output transistor is ON and the OFFs mean that the output transistor is OFF.

Direction of rotation: CCW
Counterclockwise as viewed from the shaft → CCW direction

Note: Phase A is $1/4T \pm 1/8T$ slower than phase B.

Voltage Output E6B2-CWZ3E

Direction of rotation: CW
Clockwise as viewed from the shaft → CW direction

Note: Phase A is $1/4T \pm 1/8T$ faster than phase B

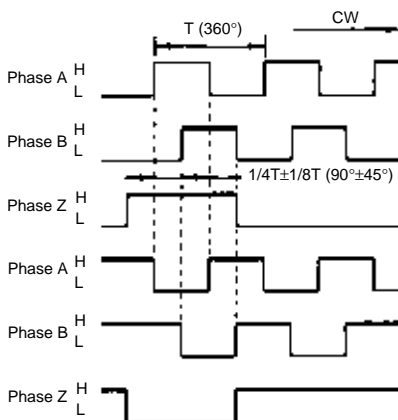

Direction of rotation: CCW
Counterclockwise as viewed from the shaft → CCW direction

Note: Phase A is $1/4T \pm 1/8T$ slower than phase B.

Line Driver Output E6B2-CWZ1X

Direction of rotation: CW
Clockwise as viewed from the shaft → CW direction

Note:
The line driver output circuit is an RS-422A data transmission circuit consisting of two balanced output lines. The relationship between the two output lines is on an equal status. This means that if the level of the signal on a line is H, the level of the signal on the other line is L. The noise-resistant line driver output circuit assures high-speed data transmission.

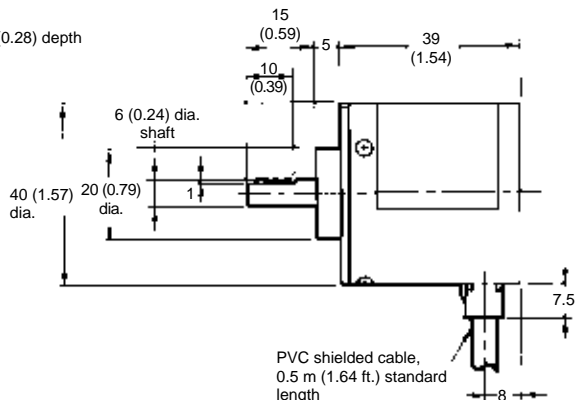

Direction of rotation: CCW
Counterclockwise as viewed from the shaft → CCW direction

Installation

■ INPUT TO MORE THAN ONE COUNTER FROM ENCODER WITH VOLTAGE OUTPUT

Use the following formula to obtain the number of counters to be connected to a single E6B2

$$\text{Number of counters (N)} = \frac{R1 (E-V)}{V \times R2}$$

- E: Voltage supplied to Rotary Encoder
 V: Minimum input voltage of the counter
 R2: Output resistance of the Rotary Encoder
 R1: Input resistance of the Rotary Encoder

■ ORIGIN INDICATION

It is easy to adjust the position of phase Z with the origin indication function. The following illustration (on the left-hand side) shows the relationship between phase Z and the origin. Set cut face D to the origin as shown in the illustration (on the right-hand side).
